Why shouldn't we go to New Jersey? It's freezing! We shouldn't go to New Jersey for Winter Break. First of all, the temperature is very low. Also, the humidity is high. Finally, the conditions are bad. I say that we shouldn't go to New Jersey for Winter Break because of the temperature but I bet you would like to know how bad it really is.

The temperature is too cold to be going to New Jersey for Winter Break. First of all, New Jersey is closer to the North Pole than to the equator. First of all, most of the temperatures were below 15° C. Also, if the temperature is warmer, we can see more flowers, trees, shrubbery, etc. Now you know how bad the temperature is but also, the humidity is forcing me to say no go.

Humidity is a bump in the road that we face if we were to go to New Jersey. First of all, 68% of 22 of the days the humidity was 60% or higher. Also, because of global warming, New Jersey is very humid for the Winter. Finally, if there is no humidity, we can go to zoos, parks, amusement parks, etc. Humidity, temperature, and one last thing, the conditions, are the three things that make going to New Jersey a no no.

The bad conditions make otherwise likely and fun trip into a disaster. First of all, out of 22 days, most of them were overcast. Also, the earth rotates and in the winter, there is less sunlight and the trees, flowers, grass, etc. dies. Finally, not very many days had clear skies. The conditions are what truly brings out the stop sign that is saying not to go.

These are the reasons why we shouldn't go to New Jersey. In case, you forgot any of them, I will run through them again. First of all the temperature is too low. Also, the humidity is too high. Finally, the conditions are bad. If you want to have a good vacation, I would not recommend New Jersey.
